Leiden

## Outline

- Background
- Evaluating RTOs and bibliometrics
- Research evaluation and science-society connections
- Case study: the Netherlands
- Wrap up

## Background

- RTOs are valuable and relevant actors in the R&D landscape
- RTOs are not universities or academic research institutes
- RTOs often wish to be (and actually are) assessed as academic actors
- Leiden manifesto on use of evaluation metrics

## Leiden manifesto for research metrics

- 10 principles to guide research evaluation
- Principle 2: Measure performance against the research missions of the institution, group or researcher
- This principle implicitly refers to evaluation of RTOs and other non (primarily) academic actors

## Mission RTOs

The European Association of Research and Technology Organizations (EARTO), defines RTOs mission as follows:

*“The core mission of Research and Technology Organizations is to harness science and technology in the service of innovation, to improve quality of life and build economic competitiveness” (EARTO, 2015).*

## Why is it unsuitable to assess RTOs as if they were universities?

- Citation based impact is often biased towards the partners they collaborate with;
- Collaboration of PROs often involves dual affiliations.

## Scientific performance TNO

Period	2006-2015
P	5,249
TCS	13,973
MNCS	1.16
PP (top10%)	0.12
PP (collab)	0.90
PP (Intl collab)	0.42

## Dual affiliations (share of publications)

# **How to account for a non-academic mission when using bibliometrics?**

# Publication data RTOs

## Information within

- References
- Citations
- Co-authorships
- Content
- Context

## Addition information

- Mentions in policy documents
- Mentions in news
- Mentions in blogs
- Mention in social media
- Citations in Patents

## Impact assessment of RTOs using bibliometrics and related data

- Case study of the Netherlands
- Map of all sciences
- Distribution of science-society communication signals
- Overlay by actor-type (university, PRO, RTO)
- Characterizing actors by dimension

# Signals between science & society

- Information within
  - Co-authorship with non-academic authors
  - Sources
- Additional information on publications (i.e., mentions in)
  - Social media
  - Policy documents
  - News items
  - Patents

KNAW NL	0.037	0.045	0.060	0.004
NWO	0.030	0.014	0.042	0.002

## Conclusions (primarily based on the Dutch case)

- RTOs can be assessed by bibliometric data, but
- Scientific performance (based on citations) may be misleading
- Alternative metrics provides an addition to monitor socio-economic impact
- Publication-based classification together with signal data provide framework for assessing society connectiveness of research

## Discussion point

Science-society connectedness should not be measured or monitored at the level of actors but on the level of the research area, the community to which an actor belongs

**Thank you**
